OUR EXPERTISE IS UNDENIABLE

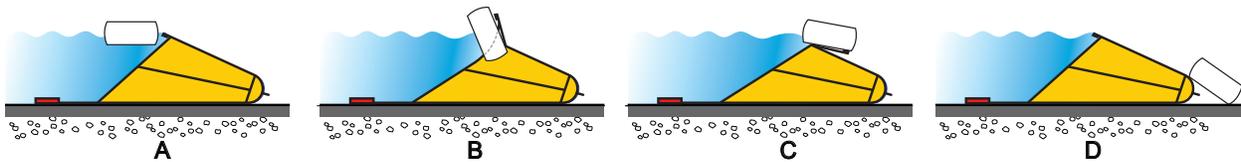

This complement to our User's Guide is intended as a help for the decision maker, buyer or engineer interested in purchasing one of our products. The Water-Gate water barrier was first marketed in 1998 and has continued to be in demand around the world since that time. MegaSecur has sold over 3000 water barriers in more than 25 countries. We've acquired solid expertise in the area of floods, underwater work and in several other fields as well, such as hydrology, hydroelectric dam raising, settling tanks, etc. Our customers are varied, but all are highly satisfied with our products.

QUESTIONS MOST OFTEN ASKED BY OUR CUSTOMERS

What happens if fragments in and on the water smash against the Water-Gate barrier?

Rigid systems are vulnerable and dangerous if they are hit by large fragments. Systems filled with water or air will deflate and lose their rigidity (hold) if fragments hit and damage their structure. As for sandbags, if they are pushed out of the way by large fragments this can create a large gap in the dam and flood control will be lost.

The Water-Gate water barrier has the amazing ability to hold back all fragments in the water due to its great flexibility. If one or more large objects are being projected at high speed against the barrier, be it from a parallel, sideways or perpendicular angle, the barrier will act like a spring. The object being thrust against the barrier will automatically be pushed away from the barrier with little risk of damaging it.

If there are fragments floating on the water, they will fold down the top of the barrier as they hit it, go over it and end up at the back of it. Should the barrier get hit very hard by a floating object, it could tear at the top. However, we are confident that it would hold out until the flood was contained.

If a wall or a tree falls on the barrier during a flood, what solution do you propose?

The water barrier will simply wrap itself around the object that fell on it and only a small amount of water will go over the barrier. All you have to do is remove the fallen object, and the barrier will regain its original position. The risk of tears from an object falling on the barrier is pretty low. Should there be a hole or a tear, it can easily be repaired by placing a piece of fabric inside the barrier. The fabric will adhere to the inside wall simply from the pressure of the water entering the barrier.

We believe that in the case of a heavy object falling, the Water-Gate barrier and sandbags would be the only flood control devices that would hold out.

What skills are required for installation? Is training necessary?

No particular skills are required. However, basic training is recommended. Installation is simple but does require a minimum of understanding. Our User's Manual explains all applications and shows how easy it is to install the water barrier. Chances are you will find everything you need to know in this manual. If you have any questions after going through it, a technician at MegaSecur will be happy to give you more information.

Can the Water-Gate system open up fast enough to stop waves?

The Water-Gate water barrier will open at the same speed as that of any waves coming in. This means that regardless of the speed of the oncoming water, the barrier will open up like a parachute does in the wind. However, if a wave has white caps on top of it, the surplus of water will go over the barrier and will need to be pumped. To contain all types of waves, our water barriers can remain open. There are small holes at the base and at the top of the partitions in which stiff rods can be inserted to keep the barrier open at all times.

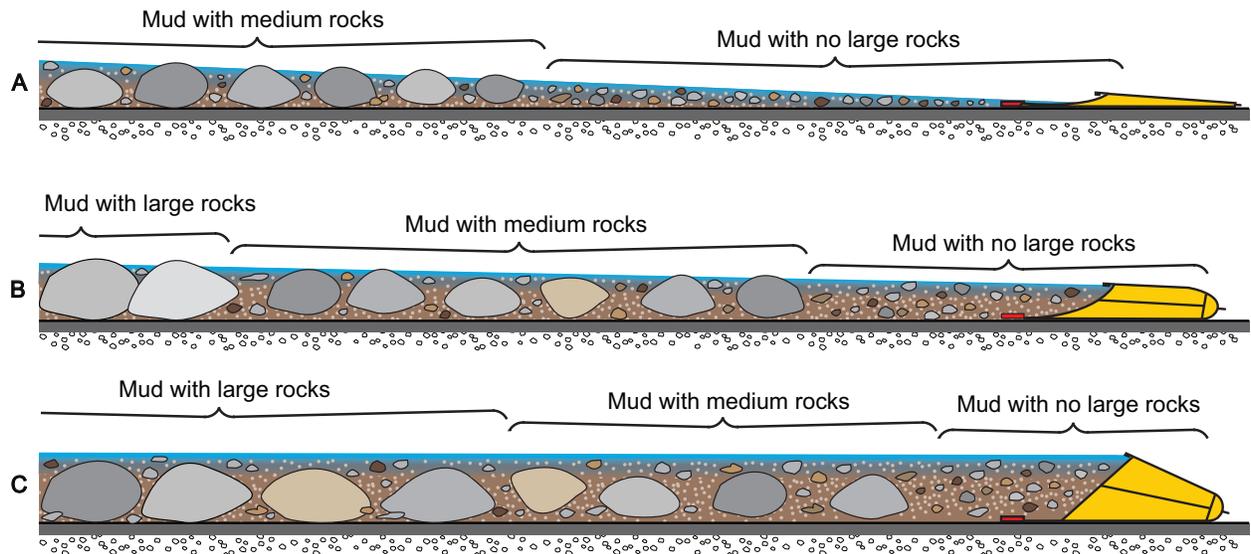

If the flood is a mudflow, and huge rocks get dragged down, will the Water-Gate barrier withstand the flood?

Yes, the water barrier can easily withstand the pressure from a mudflow. Careful trials were carried out with success. As mentioned in the User's Manual (Safety Standards), the water barrier is at least three times stronger than required. Given the fact that the density of thick mud is approximately 1.65, the safety margin is excellent.

As far as the presence of large rocks is concerned, we invite you to observe what usually takes place during a mudflow. At the beginning, there is a lot more water than mud and there are no rocks. Medium size rocks are typically found upstream and larger rocks are even further upstream. Based on our expertise, we know that the barrier will first fill up with relatively thin mud. Medium size rocks will arrive next.

The larger rocks will only be found at the end and will never reach the barrier. Because of this, a mudflow will not compromise the safety of the water barrier.

If the water barrier is left for several months or even several years in a stream, will it stay in place during that period?

Yes, the barrier will stay in place provided the water level is not much higher than the top of the barrier. (Refer to our Instruction Manual; WA Category – TWO PRINCIPLES OF ADHESION OF THE BARRIER INSTALLED IN STREAMS) Do not forget that the flow of a stream never remains the same due to alternate periods of drought and abundant rainfall. Also, in northern areas, the water barrier can be disturbed by moving ice.

Observation: If the water barrier remains in a stream for a month or longer, a light coat of silt will form inside, on the fabric at the bottom of the immersed barrier. After four months, only 50% of the fabric will remain visible due to the thickness of the silt.

Will the barrier withstand parallel water flow?

Parallel water flow is not a problem. In the example on the right, there was more water flowing than the barrier is intended to withstand, and the current was swift. In this same trial with lots of parallel flowing water, we attempted to damage the barrier with wood fragments. Our testing process was rigorous but did not result in any damage to the barrier.

What about leaks from the Water-Gate system?

No flood control system is 100% leak proof. Even if a system were completely watertight, there would be leaks through the ground from waste pipes, in addition to rainwater falling on the part of the ground that you are trying to protect.

Water leaking through the barrier generally flows under the barrier, between the bottom of the barrier and the ground underneath it. Leaks occur because of the unevenness of different surfaces. However, the more the Water-Gate barrier fills up with water, the more watertight it becomes.

If the water barrier is laid down on a regular asphalt surface, with 10 cm of retained water, the size of the leaks can be around 4 litres/min per linear metre. However, if the barrier retains 50 cm of water, only about 2 litres/minute per linear metre will leak from it.

Your emergency plan should definitely include pumps to remove any water leaking through the flood control barrier. We recommend using gas powered water pumps that do not depend on electrical power and to plan for leaks that may be greater than the amount of water expected to flow under the barrier.

Will the Water-Gate barrier withstand freeze-thaw cycles?

Our PVC fabric manufacturer warrants its product against cracking at a temperature of -30°C , and the polyethylene partitions are guaranteed to withstand temperatures as low as -40°C .

The PVC fabric and polyethylene used to make our barriers are the same as those used for road transport and car shelters. They are very resistant to extreme temperatures and have proven their worth over several decades of freeze-thaw cycles.

The water barrier in the photograph on the right was placed in a stream at a temperature of -20°C for a period of three days. A layer of ice formed on the inside, at the top of the PVC (yellow) fabric, but was very easy to remove by just tapping the barrier. The ice came unstuck, immediately floated to the top of the barrier, slid over it and ended up behind it. We were then able to dismantle the barrier in the same way as in summer, with the exception that the remaining water quickly formed into ice crystals, and the barrier became instantly dry and clean.

OUR STORAGE BAGS

Three types of storage bags are available depending on the barrier category and model.

The “drawstring” type is the most popular because it is easy to use and less expensive.

The “handbag” type provides quick access to the barrier and is easy to handle.

Finally, the “blanket” type bag is used for heavier barriers that may require handling by more than one person.

TECHNICAL SPECIFICATIONS OF OUR FABRICS

The technical specifications in the chart below are minimum requirements for all specified properties. These specifications enable us to guarantee our durability standards, which are three times higher than required. You have our assurance that in the majority of cases, our fabrics are much more resistant than the specifications outlined below.

PVC Fabric	For models WA - 15, WA - 21, WA - 28, WL - 06, WL - 14, WL - 20 and WL26		For models WA - 39, WA - 50, WA - 60, WL - 39, WL - 50 and WL - 60

SIZE AND WEIGHT OF CRATED BARRIERS

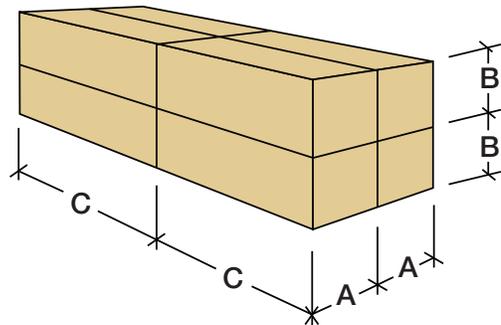

For the WL category only

To purchase crated barriers from MegaSecur, there is a cost over and beyond that quoted in our price list. These extra amounts are charged for two reasons: **1** – Folding the barriers to be packed in crates requires more time for our employees than packing blanket type individual barriers. **2** – The cost of the crate can vary substantially based on your needs. A crate can be made out of pallet wood, pressure treated wood panels, painted to your specifications or even be built from steel and assembled on wheels. It all depends on your requirements. This is why the cost of manufacturing the crate has to be estimated for each order.

As an example, the cost can represent 1 to 4% of the purchase price of the barrier when the crate is made out of wood.

- A** – Size can vary by 2 to 8%
- B** – Maximum size per crate
- C** – Size based on requirements

Because **A** varies little and **B** is a maximum size, cases can be piled up or placed one beside or behind the other, to fit the available space in your emergency response unit.

A few examples of the size of the areas required for crated barriers

Barrier model (water retention)	Outer dimension of crate			Number of barriers	Total length of protection	Total weight (barrier only)
	A	B	C			
WL - 0630 15 cm / 6 in	50 cm	60 cm	1 m / 3'-3"	6	55 m / 180 ft	150 kg / 330 lbs
	20 in	24 in	5 m / 16'-5"	32	292 m / 960 ft	790 kg / 1,750 lbs
WL - 1450 35 cm / 14 in	1,12 m 44 in	1,12 m 44 in	2,5 m / 8'-3"	18	274 m / 900 ft	760 kg / 1,670 lbs
			5 m / 16'-5"	40	609 m / 2000 ft	1,68 t / 1,85 tons
			13,6 m / 44'-7"	120	1 829 m / 6000 ft	5,1 t / 5,56 tons
WL - 2050 50 cm / 20 in	1 m 40 in	1,12 m 44 in	2,5 m / 8'-3"	13	198 m / 650 ft	700 kg / 1,550 lbs
			5 m / 16'-5"	29	442 m / 1450 ft	1,56 t / 1,71 tons
			13,6 m / 44'-7"	89	1 356 m / 4450 ft	4,8 t / 5,25 tons
WL - 2650 67 cm / 26 ½ in	1,20 m 47 in	1,12 m 44 in	2,5 m / 8'-3"	13	198 m / 650 ft	890 kg / 1,950 lbs
			5 m / 16'-5"	28	427 m / 1400 ft	1,91 t / 2,1 tons
			13,6 m / 44'-7"	86	1 310 m / 4300 ft	5,9 t / 6,5 tons

WL - 6050 1,5 m / 60 in	2 m	1,12 m / 44 in	5 m / 16'-5"	14	213 m / 700 ft	2,8 t / 3,1 tons
	79 in	2 m / 79 in	13,6 m / 44'-7"	82	1 250 m / 4100 ft	16,2 t / 17,8 tons
WL - 7850 2 m / 78 in	2,55 m	1,12 m / 44 in	5 m / 16'-5"	10	152 m / 500 ft	3,6 t / 3,9 tons
	100 in	2,55 m / 100 in	13,6 m / 44'-7"	68	1 036 m / 3400 ft	24,3 t / 26,7 tons

CALCULATION OF INSTALLATION TIME

(For the WL category only)

Crated barrier: A Water-Gate water barrier stored in a crate can be deployed in a straight line at the speed of someone running a marathon, that is approximately 19 km/h (or one 15-m/50-foot barrier every 3 seconds), regardless of barrier width. However, if you have to bend or tie a barrier or make a corner at an angle, you will have to completely unroll the barrier or barriers and add the estimated time based on the barrier width and type of application. The diagram below provides a good estimate of how much time you will need, based on your application.

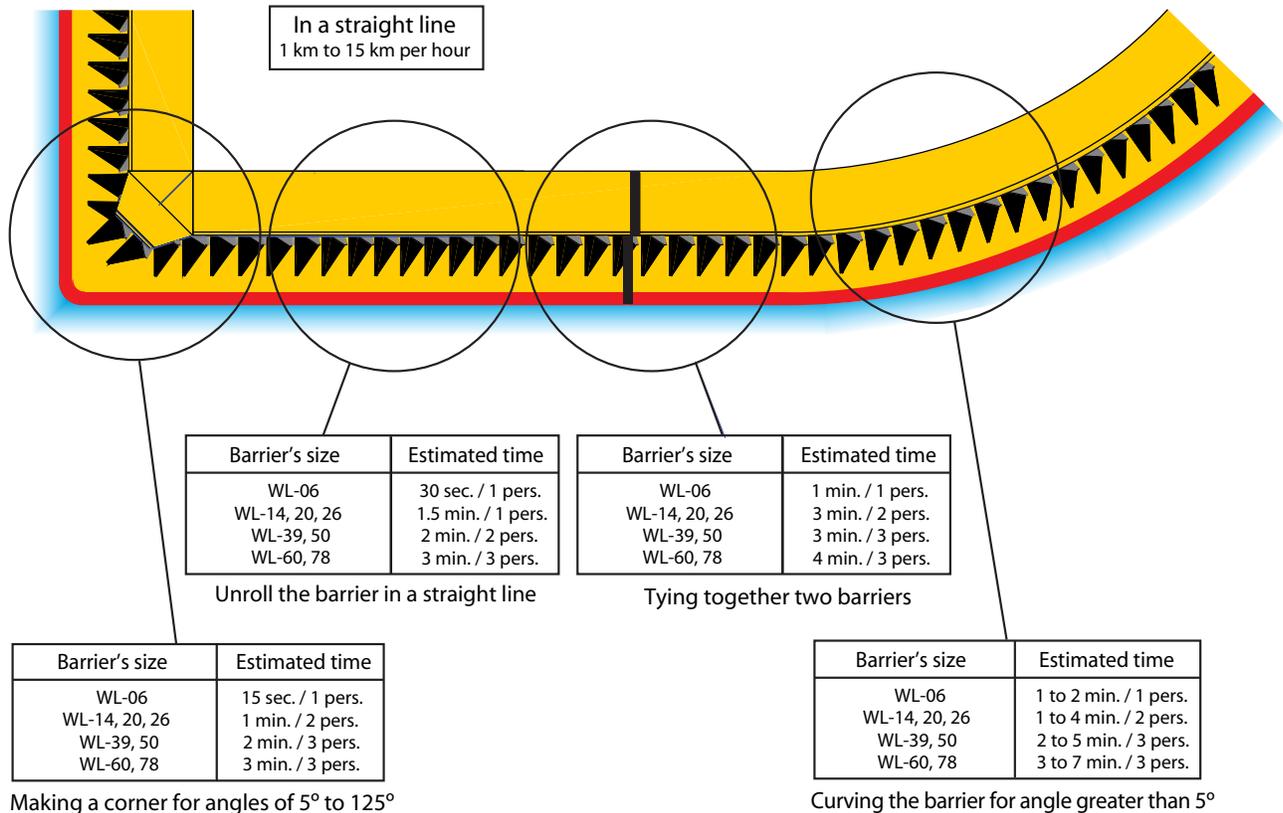

Deployment in a straight line can be done at the speed of a marathon runner.

Individual rolled barrier: To enable them to be carried to the location of the flood, these water barriers are wrapped in storage bags equipped with solid straps to facilitate handling by one or more people.

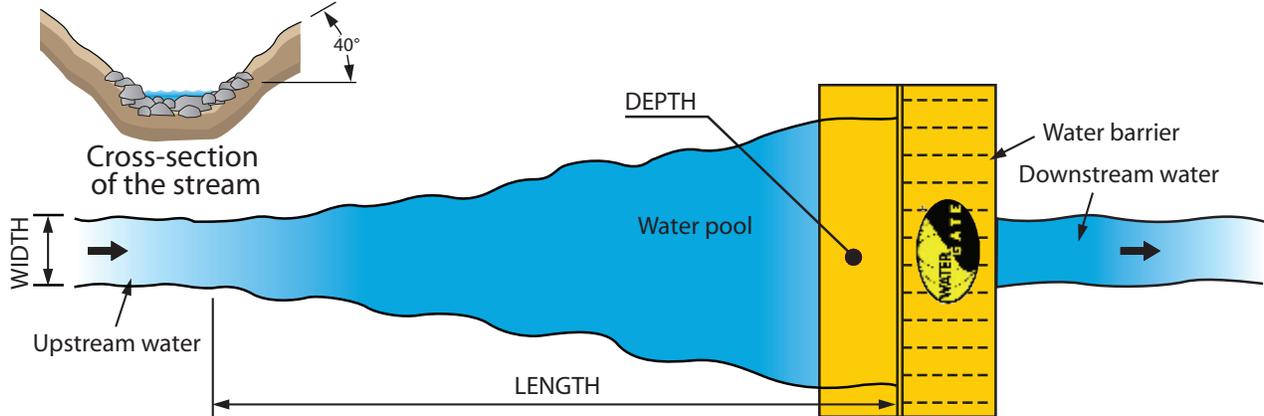

The table below shows the estimated time it takes to install a barrier with a length of 15 m/50 feet (except for the WL-06 model, which is 9.1 m/30 feet in length).

ESTIMATING THE SIZE OF A CONSERVATION POOL

(Mainly for the **WA** category)

This estimate of the conservation pool that the water barrier can contain is very basic, as streams are never straight and the banks are not well defined. However, we took into consideration the width the bottom of a stream that has a slight downward grade running at a 40° angle on each side. Keep in mind that the flow of water to the pool is constant and that the estimated size of the pool would only be exact if the stream stopped flowing and the water barrier was watertight.

Metric measures

Width of stream	Depth	Length	Size of pool in litres
1 m	35 cm (WA -15)	10 m	2 420 L
		30 m	7 280 L
		150 m	36 400 L
	53 cm (WA -21)	10 m	3 480 L
		30 m	10 450 L
		150 m	52 250 L
